

Create a loosely coupled application which simulates insert | update | delete of any data into database.

TODOs:

- One should be able to insert | update | delete into any database
- Application should be extensible to accommodate any future database without re building itself
- Any user of your application should be able to write log as per his / her own need while insert | update | delete happens.
- This user should get notification about the successful insertion | update | deletion.
- Program will be menu driven

Hint: Use IOC Container | DIP | Events & Delegates
